Marc Zaiser 21.10.2026

DSA103 – Assignment 10

	Findable	Accessible	Interoperable	Reusable	FAIR?
Source 1	Has a DOI	Abstract and metadata are open, but full text is behind (free) login wall. But supplementary information could not be opened	The data sit in a spreadsheet attached to a journal supplement, which could not be opened	The only data statement is that data are “in the supplementary materials”. No data licence, no separate repository, and the underlying LC-MS data reactions are not deposited anywhere	No
Source 2	No DOI, no link or citation of the paper. Also, third-party repository as user is not one of the papers authors	Openly reachable over HTTP but being a GitHub repository, content can change at any time, making some content possibly inaccessible at any time	CSVs are semicolon-delimited and GitHub failed to render them as tables. Also, headers have no units or definitions	The README has one line without any license file with the data seemingly being a row copy of the paper’s dataset. So the redistribution terms are unclear	No
Source 3	Has a DOI and is indexed	The statement says it is “proprietary” to Roche and “not publicly available”,	The methods describe the representations used (RDKit 2022.09, hashed 256-bit ECFP with radius 2,	The paper gives software versions (PyTorch Geometric 2.0.2, PyTorch 1.10.1, XGBoost 1.6.2),	Partly

		and that interested researchers “may contact the corresponding author”. This does not count as clear, standard access procedure which could still satisfy the FAIR condition. Also, metadata record is missing	2D/3D graphs, one-hot condition encodings). The introduction also endorses standardized, machine-readable formats such as ORD and UDM but the paper never states the format of its own dataset. Also, Catalysts appear under in-house abbreviations. The Fig. 4 caption gives full names, but there are no machine-readable identifiers like SMILES or InChI.	hyperparameters, the cross-validation scheme, and the filtering that reduced 6799 reactions to 3346 (components with at least 40 reactions). It also explains how yields were determined.	
Source 4	It has a DOI and open access, but almost no descriptive metadata: no description, no keywords, no ORCID, no affiliation and no related identifiers. The author appears only as "Маликов И.Р."	It is open on Zenodo, with a CC BY 4.0 licence.	The record is a single PDF with no structured or linked metadata.	The licence is clear, but provenance is not. It is also labelled “Dataset” although it appears to be a text article rather than data, which undermines its description.	No
Source 5	It has a DOI, a detailed description and bilingual keywords.	It is open with CC BY 4.0, and the data are downloadable in a standard way.	It uses open formats (CSV) and a datapackage.json that describes the files,	It has documentation, a metadata archive, a licence, and named	Yes

	It is in the Robert Koch Institute community, indexed in OpenAIRE, and linked to its GitHub source.		with ROR-linked affiliations and a declared language.	project contributors with roles.	
Source 6	It has a DOI, ORCIDs for all five authors, ROR affiliations, funding (SNSF NCCR Catalysis), and EuroSciVoc and keyword tags. It also links to a project page and a GitHub code repository.	Open on Zenodo	All 10.4 GB are in one zip-file and the record doesn't say what is inside (formats, structure, a data dictionary)	The licence is explicit (CDLA-Sharing 1.0), but the description is one sentence that defers to an external webpage that could change.	Partly
