Department of Chemistry

DSA103 Advanced Chemical Data Science

Lecture 17: Starting Projects

Prof. Meredith C. Schuman

meredithchristine.schuman@uzh.ch

Walker TWN et al. (2023) Leaf metabolic traits reveal hidden dimensions of plant form and function, doi:10.1126/sciadv.adi4029

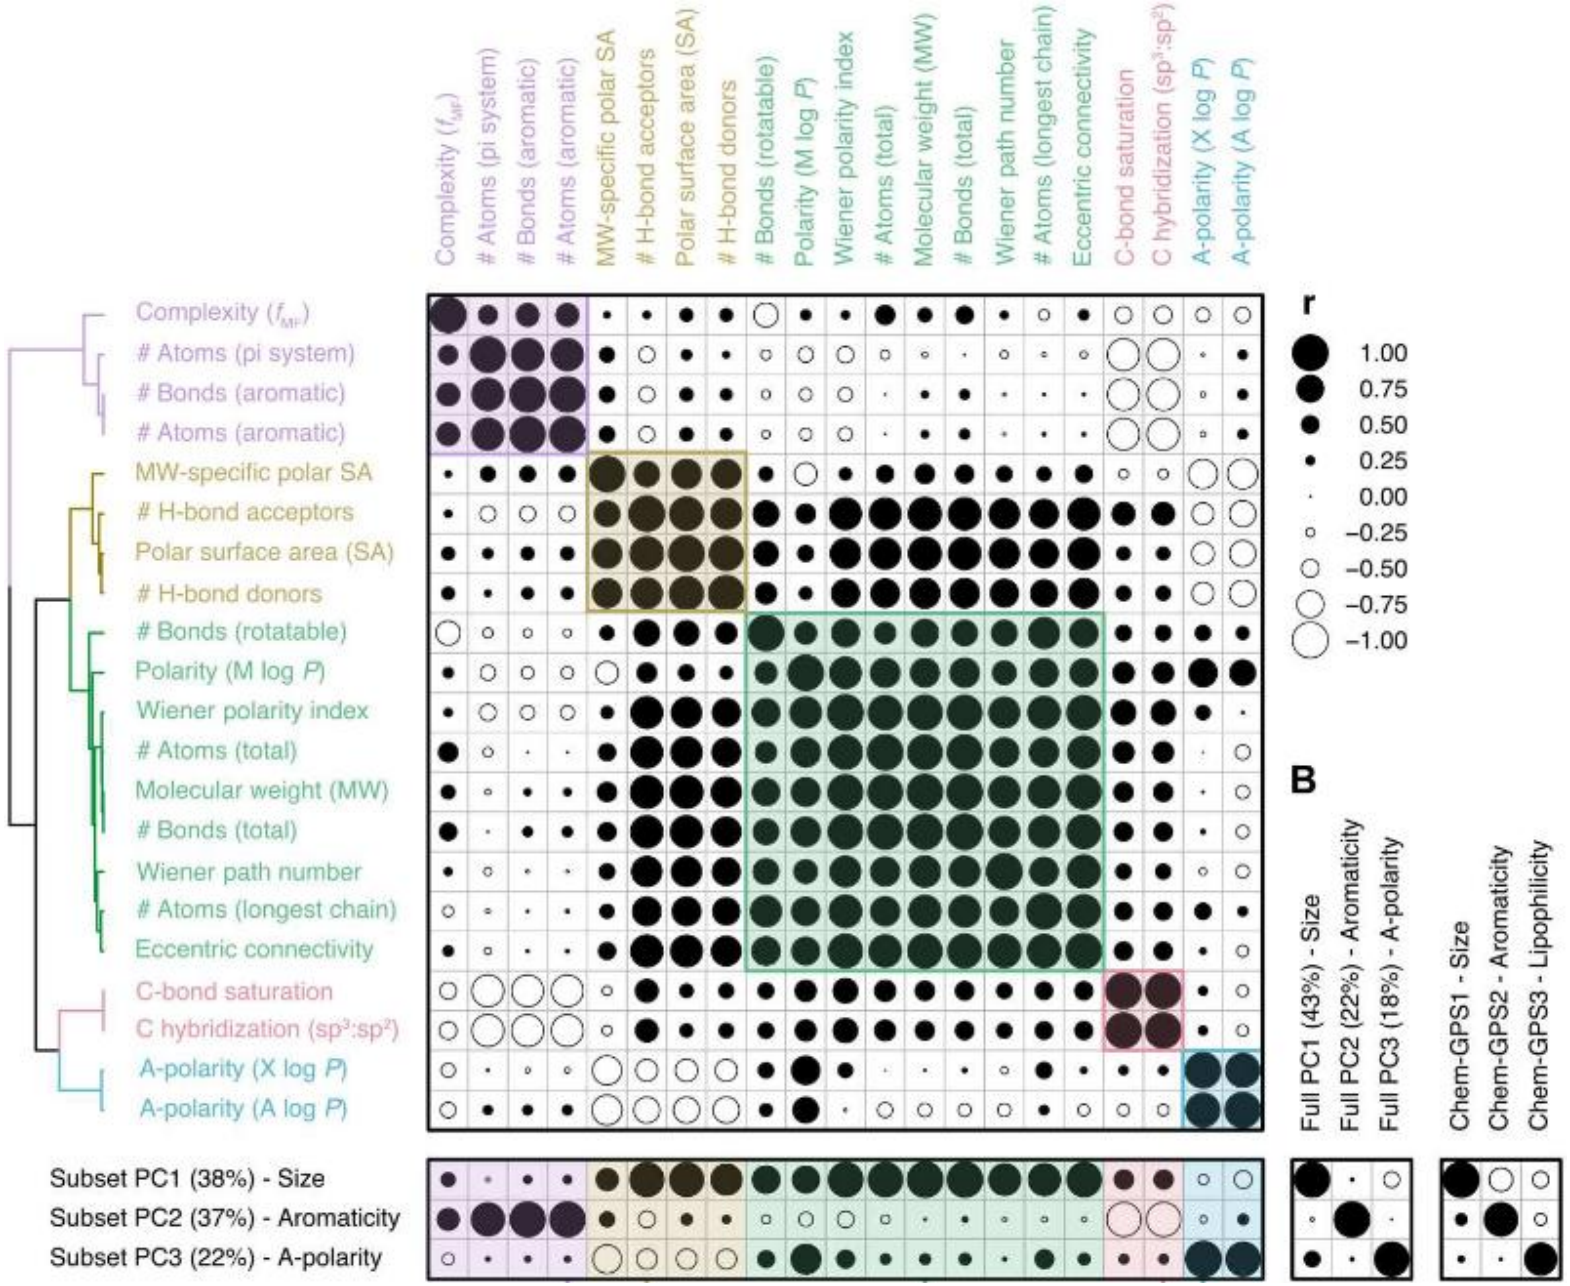

Starting on projects

Make a new repository for your project with the contents of the folder assignments\sessions17-18_project.

Then:

- Read the paper and summarize key points for yourself: fill in “ReadingScientificPapers”
- Make your documentation and data management plan: fill in “DocumentationDataManagement Template”

Discuss with each other and get started on these. I’m here for questions. We’ll continue together on Friday.

Walker TWN et al. (2023) Leaf metabolic traits reveal hidden dimensions of plant form and function, doi:10.1126/sciadv.adi4029

Project assignment

To hand in by 23:59 on Fri Dec 4 by sharing your repository:

- Filled-out sheets “ReadingScientificPapers” (for Walker et al. 2023) and “DocumentationDataManagementTemplate” (for your workflow)
- A one-page data story on your project (I’ll introduce this Friday)
- Your code in Python*

*Note that Walker *et al*. has associated source data and code – have a look at it! Their code is in R, so you won’t be able to directly adopt it in Python, but it will help you see exactly what they did.
